No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The sequence may be expressed in e.g. COS-7 cells. The encoded protein, its ligands or fragments, and antibodies may be used for the treatment of transplant rejection, graft-versus-host disease, autoimmune disease, etc.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Tr4-L-h-1 is a specific binding partner (sbp) to the ACT-4 ceptor polypeptide (encoded by this sequence) on the surface of tivated CD4 positive B cells. The sbp and its fragments are useful pharmaceutical compositions to modify a patient's immune response well as having application in the treatment of transplant

antigen activated T-cells, especially, for example, CD4+ T-cells. human cDNA encoding the human OX-40 homologue was cloned as follow Using the Experimental Autoimmune Encephalomyelitis model in rats the OX-40 antigen was identified (expressed on the surface of activated autoantigen-specific CD4+ T-cells present at the site of inflammation but absent on CD4+ T-cells at non-inflammatory sites) and cDNA encoding the antigen was isolated. PCR primers were designed and used to clone murine OX-40 cDNA by PCR from RNA isolated from murine CD4+ T-cells activated with concentrative.

The published patent application states that the OX-40 cDNA sequence is also in SQ ID no. 1, but this sequence is not present in the spec. A nucleic acid having the sequence in SQ ID no 1 and the polypeptide encoded by it are claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

                                                                                                                                                                                                                                                                 This plasmid encodes an OX40/Fc antibody fragment mutein protein, and is used to express a soluble OX40/Fc mutein fusion protein for use in detecting cDNA clones encoding a OX40 ligand. The Fc fragment may be derived from human IgG1, and the plasmid may be used to transform the CV-1/EBNA (ATCC CRL 104/8) monkey kidney cell line. Culture supernatant was purified by affinity chromatography and this was used, together with labeled goat anti-human IgG to screen various cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CDS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  fusion protein that contains the extracellular domain of mouse OX40 fused to the mutated Fc region of the human IgG1 antibody. The fusion protein was used for detecting cDNA clones encoding an OX40 ligand. The invention claims for a murine OX40-L cytokine (AAW48975) that binds to the murine T cell antigen, OX40. The OX40-L protein is claimed to be useful for co-stimulation of T-cell production and in binding assays for detecting OX40 or its homologues. The OX40-L protein is also claimed to generate a TH-2 immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Baum

                          The present sequence represents the mouse OX40 extracellular domain encoding cDNA. The extracellular domain of OX40 is its ligand binding domain. The present cDNA was used in the construction of the chimeric OX40/Fc cDNA (AAV32640). The invention claims for a murine OX40-L cytokine (AAW48975) that binds to the OX40 murine T cell antigen. The OX40-L protein is claimed to be useful for co-stimulation of T-cell production and in binding assays for detecting OX40 or its homologues. The OX40-L protein is also claimed to generate a TH-2
                                                                                                                                            Purified polypeptide OX-40 ligands production and binding assays for C

The invention relates to a nucleic acid comprising a sequence of 18 CC bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with CC bisulphite, of genes associated with tumour suppression and CC oncogenes having a sequence taken from 536 (actually 533 since CC numbers 408, 458 and 500 are missing from the sequence listing) sequences CC (SS) and sequences complementary to (SS). The nucleic acid may be a CC peptide nucleic acid-oligomer (PNA) of at least 9 nucleotides and may CC form part of a set of probes for detecting the cytosine methylation state CC and/or single nucleotide polymorphisms and also to be used in an CC array for analysing diseases associated with CpG dinucleotides e.g. CC cancers and tumours. The probes can also be used in a method for CC ascertaining genetic and/or epigenetic parameters for the diagnosis and compared to another set of genetic and/or epigenetic parameters may be CC diseases, by analysing cytosine methylations. The parameters may be CC compared to another set of genetic and/or epigenetic parameters, the CC diseases, by analysing cytosine methylations. The parameters which CC are disadvantageous to patients. The present sequence is one of the CC complementary sequences derived from tumour suppressor genes and CC complementary sequence of the corresponding odd numbered sequence (e.g. cmplementary sequence of the corresponding odd numbered sequence (e.g. cm sisting).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fragments of chemically modified genes associated with tumour suppressor genes and oncogenes, useful in designing primers and probes for analysing diseases associated with cytosine methylation state e.g. cancer

                                                                                                                                                                                                                                                                                                                                                                                                          secondary signalling sequences. The specification describes stimulatory corrections y signalling motifs. Primary motifs are efficient at at mediating immune cell signal transduction, particularly when incorporated in an intracellular signalling domain of a chimeric receptor. The primary signalling motif can be combined in any way so as to achieve the desired level of activation (or inhibition) of a number of secondary messenger cascades. The signalling motifs are useful for the primary signalling motifs are useful for the number of secondary messenger cascades. The signalling motifs are useful for the number of secondary messenger of medicament for treating or preventing disease in humans or animals. They are are useful for treating thuman patients suffering from infectious diseases e.g. human patients suffering from infections, inflammatory/autoimmune diseases usuch as asthma and eczema, congenital diseases e.g. cystic fibrosis, sichle cell anemia dermatological diseases e.g. psoriasis, neurological diseases e.g. multiple sclerosis, transplant-related disease e.g. organ transplant rejection, graft versus host disease, metabolic/diopathic

These motifs are extremely efficient at mediating immune cell signal transduction, particularly contents of a consensus amino acid sequence. These motifs are extremely contents of a chimeric contents. Nucleic acids that encode, and polypeptides that contain, contents of these primary signalling motifs are useful in medicine and research. Contents of the contain of the manufacture of a medicament for contrating or preventing disease in humans or in animals. These diseases include infections (e.g. HIV (human immunodeficiency virus) infection), contains (e.g. treating or preventing diseases (e.g. asthma or eczema), congenital continuation or autoimmune diseases (e.g. asthma or eczema), congenital continuation or sichle cell anaemia), dermatological contents, organ transplant rejection or graft-versus-host disease, or metabolic/diopathic diseases (e.g. diabetes or cancer). The construction of sequence blocks (SBs) of primary and secondary in the construction of sequence blocks (SBs) of primary and secondary continuation of the T cell receptor (TCR) complex. Secondary continuations of the transplant respector (TCR) complex. Secondary continuations of continuations of the construction of the continuations of signalling capacity to a continuation of the continuations of the con

                                                                                                                                                                              The invention relates to a novel nucleic acid encoding an adaptor CC receptor protein comprising an extracellular ligand-binding domain, a CC transmembrane domain and an intracellular signalling domain. The CC intracellular signalling domain comprises the cytoplasmic portion of at least one adaptor protein, and the extracellular ligand-binding domain CC is not CD8 or a major histocompatibility complex (MHC) class I protein. CC in therapy. They are useful in the mucleic acid encoding it are useful in the adaptor receptor protein and the nucleic acid encoding it are useful in the treatment or prevention of disease in humans and animals. They are useful in the treatment of infectious diseases (e.g. HIV infection), CC inflammatory and autoimmune diseases (e.g. HIV infection), CC congenital diseases (e.g. cystic fibrosis and sickle cell anaemia), CC dermatological diseases (e.g. psoriasis), neurological diseases (e.g.) CC multiple sclerosis), organ transplant rejection, graft-versus-host CC disease and metabolic/idiopathic diseases such as diabetes and cancer. CC The present sequence is one of a large number of oligonucleotides used in the construction of sequence blocks (SBs) of primary and secondary csignalling motifs transduce either a construction of rCCR) complex. Secondary signalling motifs impart CC cells. Primary and secondary signalling capacity to a molecule in T CC components of the adaptor receptor protein of the invention.

                                                                                                                                                                                     secondary signalling sequences. The specification describes stimulatory primary signalling motifs. Primary motifs are efficient at at mediating immune cell signal transduction, particularly when incorporated in an intracellular signalling domain of a chimeric receptor. The primary signalling motif can be combined in any way so as to achieve the desired level of activation (or inhibition) of a number of secondary messenger cascades. The signalling motifs are useful in therapy and in the manufacture of medicament for treating or preventing disease in humans or animals. They are are useful for treating human patients suffering from infectious diseases e.g. human immunodeficiency virus (HIV) infections, inflammatory/autoimmune diseases such as actions of creating such as actions of control of the series and control o

                                                                                                    signalling motifs. Primary signalling motifs are sequences that transduce either a stimulatory or an inhibitory signal, which regulates primary activation of the T cell receptor (TCR) complex. Secondary motifs impart secondary or co-stimulatory signalling capacity to a
                                                                                                                                                                                                                                        sclerosis), organ transplant rejection or graft-versus-host disease metabolic/idiopathic diseases (e.g. diabetes or cancer). The present sequence is one of a large number of oligonucleotides used the construction of sequence blocks (SBs) of primary and secondary
                                                                                                                                                                                                                                                                                                                                                                            when incorporated into an intracellular signalling domain of a chimeric receptor. Nucleic acids that encode, and polypeptides that contain, these primary signalling motifs are useful in medicine and research. They are useful in therapy, or in the manufacture of a medicament for treating or preventing disease in humans or in animals. These diseases include infections (e.g. HIV (human immunodeficiency virus) infection), inflammatory or autoimmune diseases (e.g. asthma or eczema), congenital diseases (e.g. cystic fibrosis or sickle cell anaemia), dermatological diseases (e.g. psoriasis), neurological diseases (e.g. multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to novel primary signalling motifs containing a consensus amino acid sequence. These motifs are extremely efficient at mediating immune cell signal transduction, particularly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acids encoding polypeptides with expanded primary signaling motifs, for use in gene therapy, particularly for treating or preventing infections, inflammations or autoimmune diseases in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2001-328791/34.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               01-NOV-1999;

RESULT 14
AAH24543
CC receptor protein comprising an extracellular ligand-binding domain, a comprising an extracellular signalling domain. The CC intracellular signalling domain and comprise the cytoplasmic portion of at CC least one adaptor protein, and the extracellular ligand-binding domain comprise to me adaptor protein, and the extracellular ligand-binding domain comprise to me adaptor protein, and the nucleic acid encoding it are useful comparts of the construction of the respy. They are useful in the manufacture of a medicament for the creatment or prevention of disease in humans and animals. They are useful in the manufacture of a medicament for the creatment of infectious diseases (e.g. HIV infection), comparts of infections diseases (e.g. asthma and eczema), compenital diseases (e.g. cystic fibrosis and sickle cell anaemia), compenital diseases (e.g. cystic fibrosis and sickle cell anaemia), compenital diseases (e.g. poriasis), neurological diseases (e.g.) compenital diseases (e.g. meurological diseases (e.g.) corgan transplant rejection, graft-versus-host compensation of sequence blocks (SBs) of primary and secondary signalling motifs transduce either a construction of sequence blocks (SBs) of primary and secondary signalling motifs transduce either a construction or an inhibitory signal, which regulates primary activation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel polynucleotide encoding adaptor receptor protein useful for treating human immunodeficiency virus (HIV) infection, asthma, cystic fibrosis, multiple sclerosis, organ transplant rejection, diabetes and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                01-NOV-1999;

                                                                                                                                                                                                                                                                                                                                                                       genes and analysing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of the T cell receptor (TCR) complex. Secondary signalling motifs impart secondary or co-stimulatory signalling capacity to a molecule in T cells. Primary and secondary signalling motifs may be used as components of the adaptor receptor protein of the invention.
                                         The invention relates to a nucleic acid comprising a sequence of 18 bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with bisulphite, of genes associated with tumour suppression and oncogenes having a sequence taken from 536 (actually 533 since numbers 408, 458 and 500 are missing from the sequence listing) sequences; and sequences complementary to (Ss). The nucleic acid may be a peptide nucleic acid-oligomer (PNA) of at least 9 nucleotides and may form part of a set of probes for detecting the cytosine methylation; and/or single nucleotide polymorphisms and also to be used in an analyor strategy and detecting the cytosine methylation; and the sequence is a sequence of the cytosine methylation is analyor single nucleotide polymorphisms and also to be used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Olek
                                                                                                                                                                                                                                                                                                        Claim 1;
                                                                                                                                                                                                                                                                                                                                                            cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                   Fragments
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (EPIG-)

The parameters may be compared to another set of genetic and/or epigenetic parameters, the differences serving as basis for diagnosis and/or prognosis events which are disadvantageous to patients. The present sequence is one of the
                                                                                                                                                                                                                                                                                                                                                                Note: The sequence data for this patent did not form of the printed specification, but was obtained in eleformat directly from WIPO at
